INSTALLATION & OPERATION

Before attempting to operate hoist be sure current supply corresponds to name plate rating.

On polyphase A.C. hoist, it is impossible to predetermine the direction of rotation. It is, therefore, important to carefully check this by pulling on end of control handle marked up. If hook travels in opposite direction or down for 3 phase interchange 2 of the wires for 2 phase interchange the 2 wires of 1 phase at power supply cord.

If hoist is operated with wrong current supply connection, the safety limit stops will not work and serious damage may result.

When facing the controller side the hoist rope should be on the left hand side, and the lowering rope on the right hand side as shown in sketch.

To operate hoist pull end of control handle marked up and hoist hook will travel in that direction. To lower hook, pull on end of control handle marked down & hook will travel in that direction down.

Hoist is equipped with upper and lower safety limit stops. Operating directly on controller shaft these safety stops prevent over travel of hook by returning controller to neutral and applying the motor brake at the limit of hook travel in either hoisting or lowering direction. In the event of over travel at the hook, the motor is automatically and momentarily reversed.

To adjust motor brake remove top screw and loosen bottom screw of both brake covers.

The correct gap between adjusting screw and cam is $1/16"$.

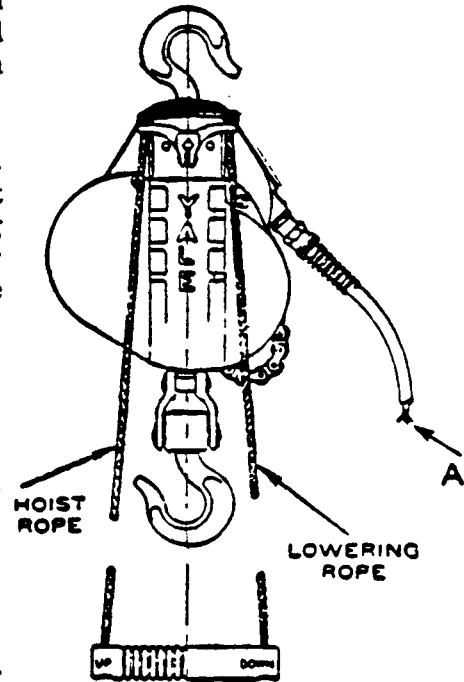

After adjusting be sure to tighten check nuts.

Apply light grease to brake cam surface.

Lubricate gears thru filler plug located in gear case cover with S.A.E. 70 gear oil fill to level of this plug.

Hoist chain (roller type) apply machine or S.A.E. 30 motor oil on full length of chain with a brush.

For link type chain see page 35.

RECOMMENDED SEQUENCE OF DISASSEMBLY FOR MIDGET KING HOISTS 250 TO 4000 POUNDS CAPACITY

1. Upper hook assembly may be removed by driving out driv-lok pin, remove collar and thrust washer. Refer to page 33 and 34 for more detailed information.

2. For major disassembly hoist may be placed on its side on the work bench or upside down in a vise which may be tightened on upper hook or swivel lug. Be certain to drain oil before hoist is disassembled or inserted in vise.

3. Remove control ropes (for convenience).

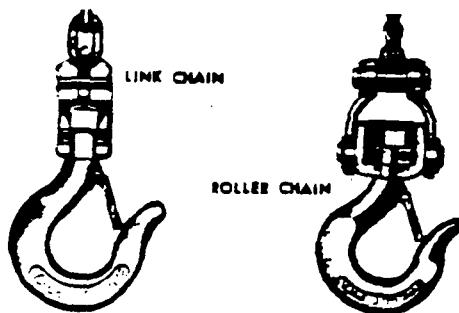

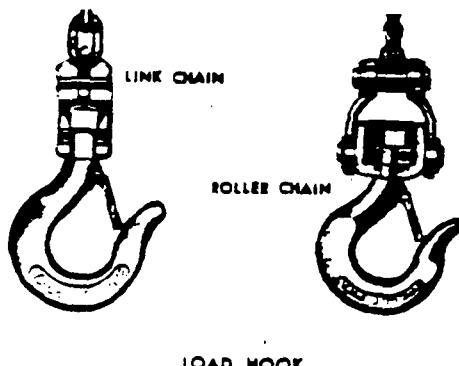

4. To remove roller or link type chain from 250 to 2000 pound capacity hoist, tail should be disassembled by removing spring clip link (91 roller chain) or spring clip link (93 link chain) which fastens chain to housing. Chain may be pulled out by:

(a) Open brake by pushing control arm down in either direction.

(b) Pull steadily on chain until tail is free of sprocket or pocket wheel.

4A. To remove roller or link type chain from 4000 pound capacity hoist in addition to Paragraph 4 above, remove cotter pin (103) and pin (104 link chain) or cotter pin (99) and anchor pin (100 roller chain). Remove load hook assembly when necessary.

5. To remove lower hook assembly from roller chain 250 pound to 2000 pound capacity hoist it is necessary to grind link pins (54); then remove pin, link and hook assembly. Reverse above to install.

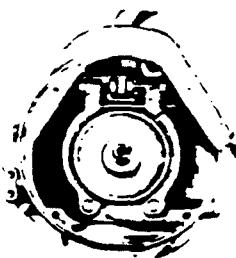

5A. To remove lower hook assembly from link chain 250 pound to 2000 pound capacity hoist it is necessary to remove retaining ring, then remove pin (54) and hook assembly. Reverse above to install.

5B. To remove lower hook assembly from link chain 4000 pound capacity hoist it is necessary to remove three nuts, lockwashers, screws and separate both halves. Reverse above to install.

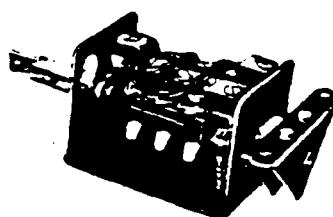

5C. To remove lower hook assembly from roller chain 4000 pound capacity hoist it is necessary to remove cotter pin, sprocket pin and separate both halves. Reverse above to install.

6. Remove screws and lockwashers from name plate, instruction plate and reversing switch cover. Remove plates and cover.

7. Disconnect and tag motor leads. Disconnect and tag leads to power source at reversing switch. Loosen motor lead wire clamp.

MOTOR BRAKE

Reversing Switch

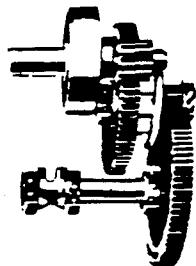

8. Remove four long screws and lockwashers. Pull off motor stator. Rotor will remain in hoist. Caution should be exercised when removing stator to avoid bending rotor shaft or damage to the windings.

9. Spread open brake shoes and pull out rotor.

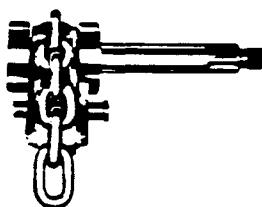

10. Remove screws (81), lockwashers (14) and reversing switch (30).

11. Remove brake shoe assembly.

12. Remove screws and lockwashers securing gear case cover (29) to gear case (1). Use caution when removing cover to avoid damage of intermediate pinion bearing. Remove gasket. Clean mating surface of gear case cover and gear case.
13. Remove outer intermediate pinion bearing.

GEAR TRAIN

LOAD SHEAVE & STRIPPER

14. Remove load sheave nut (63) and slow speed gear (61).
15. Remove cotter pin (24), washer (37), pawl (41), spring (40), pawl spring retainer (57) and spring (56).

16. Remove intermediate pinion shaft and load brake assembly.

17. If the load brake fails to hold the load it may be an indication that the brake discs are worn and in that case must be replaced.

TO DISASSEMBLE

Pull load brake assembly out of the hoist. Remove the snap ring (78), ball bearing (77) and pull off the stop washer (76). Unscrew high speed gear (79) from brake disc hub (67) which releases ratchet assembly (70). To replace brake disc (68) remove three rivets (69). To remove the ball bearings from the suspension frame and the gear case use a bearing puller.

18. Remove limit paddle assembly (49), control connecting link (33) and controller lever (31) when they are bent or damaged.

19. Remove cotter pin (22), stripper pin (21) and stripper (20).

20. Remove snap ring (62) and load sheave assembly. Outer bearing may remain in frame. Remove this bearing.

INSPECTION

1. All component parts must be thoroughly cleaned before inspection. In the absence of a pressure cleaner, a supply of clean, lint free cloths and a stiff bristle brush must be available. A source of compressed air with a nozzle is highly desirable. Heavy accumulations of grease and dirt can be scraped off with a putty knife or wooden stick. All metal parts should be coated with clean oil or grease, and then covered and kept clean until used.

CAUTION: Soaking electrical parts will break down insulation of wiring and coils. Clean the surface only and dry immediately.

Be sure all wire terminals are clean and bright. Contact points are cleaned with a lint free cloth, using dry cleaning solvent.

BEARINGS AND GEARS. It may be necessary to brush or tap each piece on a block of wood to dislodge solid particles, rinse again and dry with compressed air. Revolve bearings slowly with fingers. Air should be directed at right angles to bearing case.

CAUTION: Do not spin bearings with the air stream because any dirt deposits may scratch bearing surfaces.

Inspect all gears for knicks, scratches, worn or damaged teeth. Replace when necessary. Inspect all bearings for wear, flat spots or damage at seal. Replace when necessary. Replace all worn or damaged parts. Parts section will show what items must be purchased in sets.

METHOD FOR DETERMINING REPLACEMENT OF ROLLER TYPE HOIST LOAD CHAIN

1. Carefully inspect the chain for the following conditions:

- a. Exceptionally loose joints.
- b. Exceptionally tight or stiff joints.
- c. Worn or broken rollers.
- d. Bent, cracked or deformed side plates.
- e. Kinks or twists over entire length of chain.
- f. Extreme corrosion or rusting.

If visual inspection reveals anyone of the above conditions, the chain should be replaced.

2. If visual inspection reveals no defects, proceed as follows:

- a. Lay used chain on a flat surface and measure with a vernier caliper over eight (8) rolls while chain is pulled taut. Measurement should be taken in that portion of the chain which has most passed over the load sprocket.
- b. Repeat step (a) above to measure a new chain of the "same make" as the used chain.
- c. Subtract the new chain measurement from the used chain measurement and divide the result by seven (7). This is the elongation per pitch which is probably a combination of wear and stretch.
- d. If the elongation per pitch is .004 to .005 inches or more, it is recommended that the chain be replaced.

LINK TYPE CHAIN

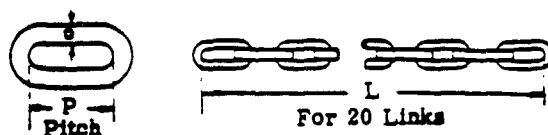

The load chain should be lubricated with oil. Lubrication greatly increases the life of the chain and reduces to a minimum the wear on load sheave pockets. The load sheave pockets should also be greased occasionally.

Periodical inspection and measurement of load chain, see sketch below, will indicate when replacement is necessary. Measure any 20 links as shown. If the chain is worn or stretched 2% longer than specified, then new chain should be obtained.

Worn or stretched chain or worn load sheave pockets can usually be detected by the noise of chain links sliding into load sheave pockets.

When replacing worn-out load sheave, test load chain for worn or stretched links by running it over a new sheave or check chain with dimensions shown below. Worn chain should not be used with a new load sheave since this condition will soon wear out the new sheave.

Always use slings, do not wrap load chain around load.

NEW LOAD CHAIN WILL CHECK UP TO THESE DIMENSIONS:

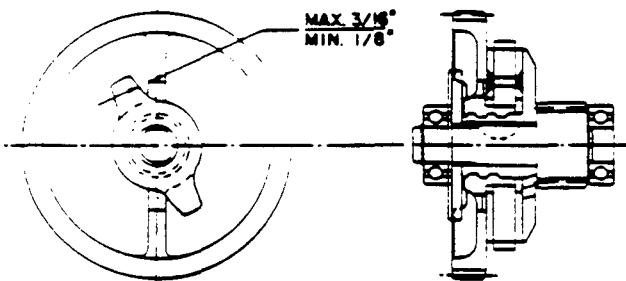

Capacity For Hoists	1/8 & 1/2 Ton	1 & 2 Ton
"D" in Inches	.1/4"	.5/16"
"P" in Inches	.750	.905
"L" in Inches	15.00	18.10

SEQUENCE OF REASSEMBLY

1. Install bearings (19) on each side of load sheave or load sprocket. Be certain oil seals are not damaged. Insert spacer (80) and bearing (64) on shaft.
2. Install load chain guide (15), lockwashers and screws.
3. Lubricate bearings and tap load sheave assembly into place then install snap ring (62).
4. Install stripper (20), stripper pin (21) and cotter pin (22). It is advisable to insert a section of chain by feeding over stripper into load sheave or sprocket to be certain stripper, load sheave and chain guide are positioned to operate properly. For installation of link type chain see page 35.
5. If the load brake has been disassembled for repairs assemble and adjust as follows:
 - a. Replace ratchet assembly (67) (Tap new ratchet on and off new intermediate pinion (66) (once) to remove metal clips.
 - b. Lubricate ratchet lining.
 - c. Screw on high speed gear (79) until it is tight.
 - d. Replace stop washer (76) as shown in drawing below:

**LOAD BRAKE
ADJUSTMENT**

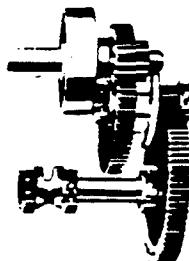

This clearance dimension must be held or brake will jam.

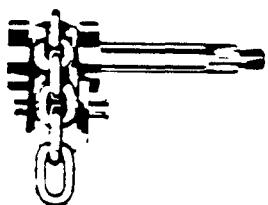

- e. Replace ball bearing (77) and snap ring (78).
- f. Insert pinion in a soft jawed vise (copper inserts may be used) turn high speed gear counterclockwise to be certain it hits the stop washer; then turn clockwise to check the 1/8" to 3/16" clearances as shown in above drawing.

6. Position intermediate pinion shaft and load brake assembly in frame.

7. Install slow speed gear (61) and nut (63) on load sprocket shaft (18) or sheave shaft. Gears must turn freely.

GEAR TRAIN

LOAD SHEAVE & STRIPPER

8. Install remaining bearing on intermediate pinion (66).

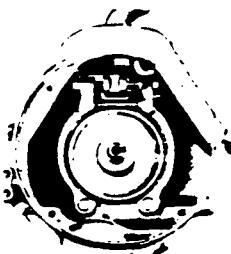

9. Place a new gasket on mating surface of gear case (1).

10. Place gear case cover (29) over gear case (1) and tap into position. Install lockwashers and screws securing cover and case. Tighten screws.

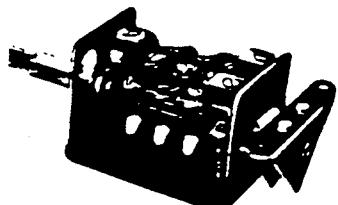

11. Place brake assembly on anchor studs.

12. Install limit paddle assembly (49), control connecting link (33) and controller lever (31).

13. Install reversing switch. Be certain controller lever (31) is in position and controller shaft is between brake adjusting screws.

MOTOR BRAKE

14. Spread open brake shoes and install rotor. Set brake as follows:

- a. Loosen adjusting screw lock nut.
- b. The correct gap between adjusting screw and cam is $1/16$ inch.
- c. Tighten lock nut.
- d. Apply a small amount of light grease to brake cam surface.
- e. Open brake by pushing control arm down in either direction, then turn rotor to be certain brake does not drag and gears turn freely.

15. Install stator. Feed wires through clamp and opening at reversing switch. Refer to page 36 through 39 for type of motor used on your particular hoist.

16. Remove tags as motor leads and power source wires are connected. Tighten wire clamp.

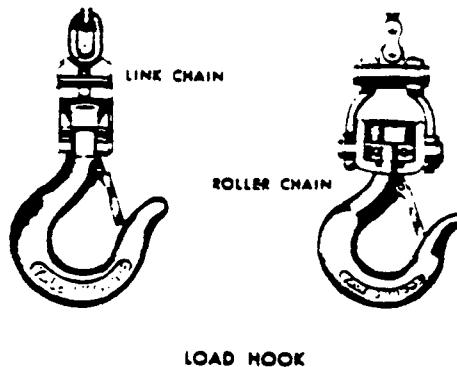

17. Install and connect roller or link type chain on a 250 to 2000 pound capacity hoist as follows:

- a. Open brake
- b. Slowly feed chain through limit paddle, past stripper and load sheave until approximately 24 to 30 inches of tail has been pulled past stripper.
- c. Insert spring clip link (91 roller chain) or spring clip link (93 link chain) through end tail link and fasten at frame anchor.

17A. Connect roller or link type chain on a 4000 pound capacity hoist as shown in Paragraph 15, then install anchor pin (104 link chain) and cotter pin (103) or anchor pin

(100 roller chain) and cotter pin (99). Install upper hook if it was removed for any reason. Refer to page 37 and 34 for more detailed information.

18. Install load hook as shown in Paragraphs 5A through 5C in disassembly section.

19. With hoist in an upright position, fill hoist to proper level. Use specified lubricant.

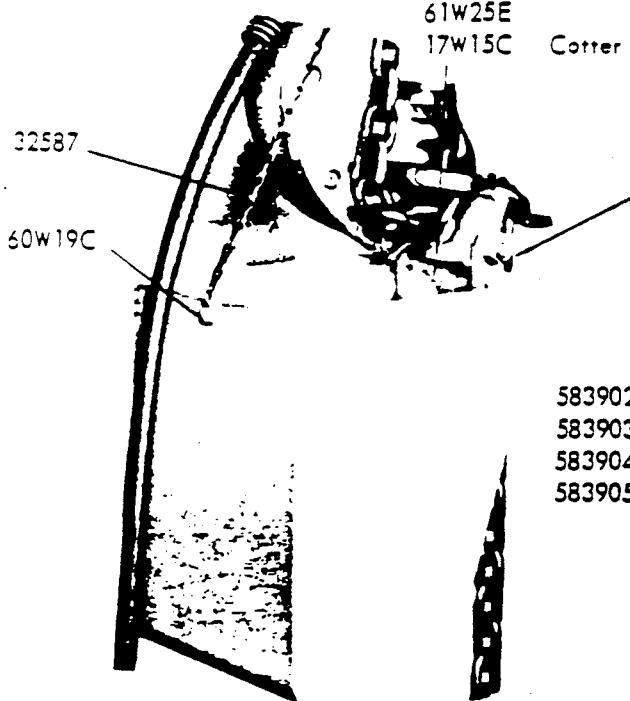

20. Install rope and handle assembly. (Up) mark on control handle must be toward load (hook) chain.

21. Install at power source. Be sure current supply corresponds to name plate rating. On polyphase A. C. hoists it is impossible to predetermine the direction of rotation. It is therefore important to carefully check this by pulling on end of control handle marked up. If hook travels in opposite direction (down) interchange any (2) wires at source.

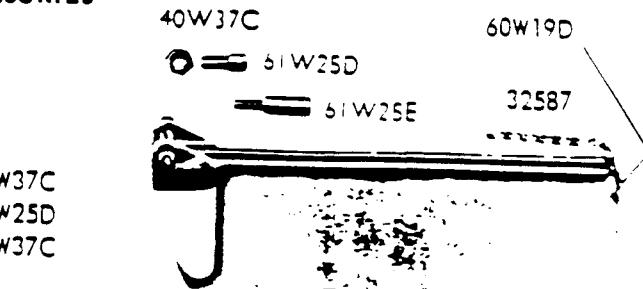

22. Limit stops must shut off power supply in both directions.

INSTRUCTIONS FOR INSTALLATION OF LINK TYPE CHAIN

With a pair of heavy alloy bolt cutters cut a vertical * link somewhere between bottom block and Hoist.

With a grinder, grind thru case of chain and then with a hacksaw cut out a section of one of the horizontal * links (as shown in figure 2).

Slip first link of new chain thru cut out link making sure that; (1) first link of new chain is a vertical * link and (2) Weld on chain is facing outward from sheave.

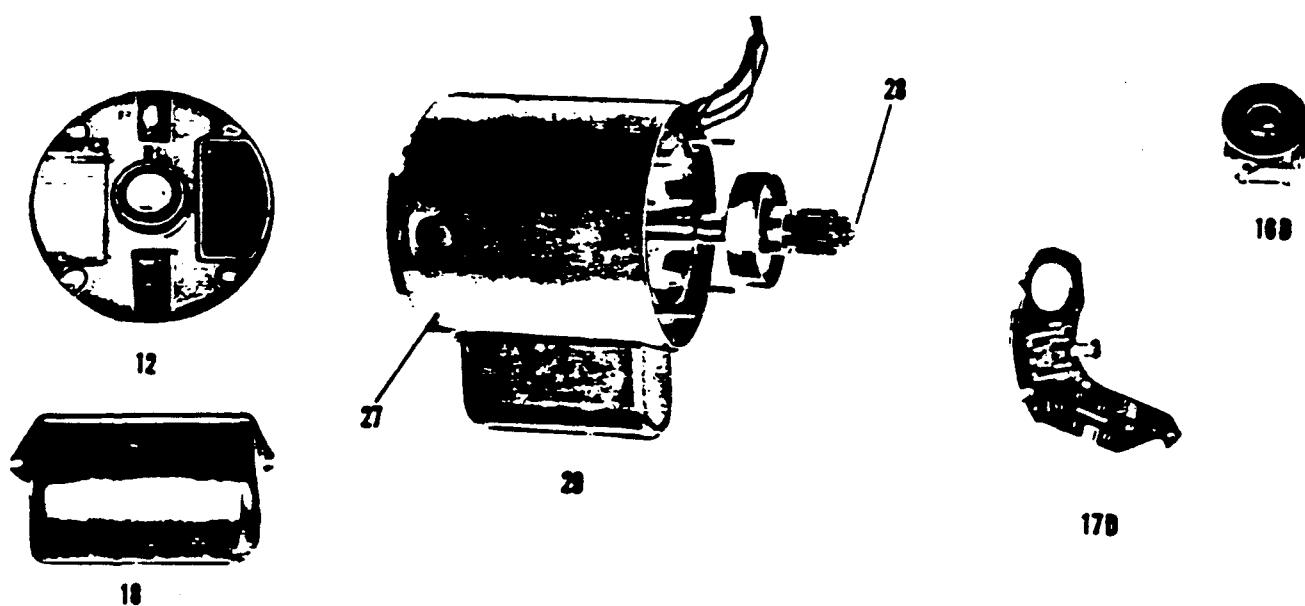

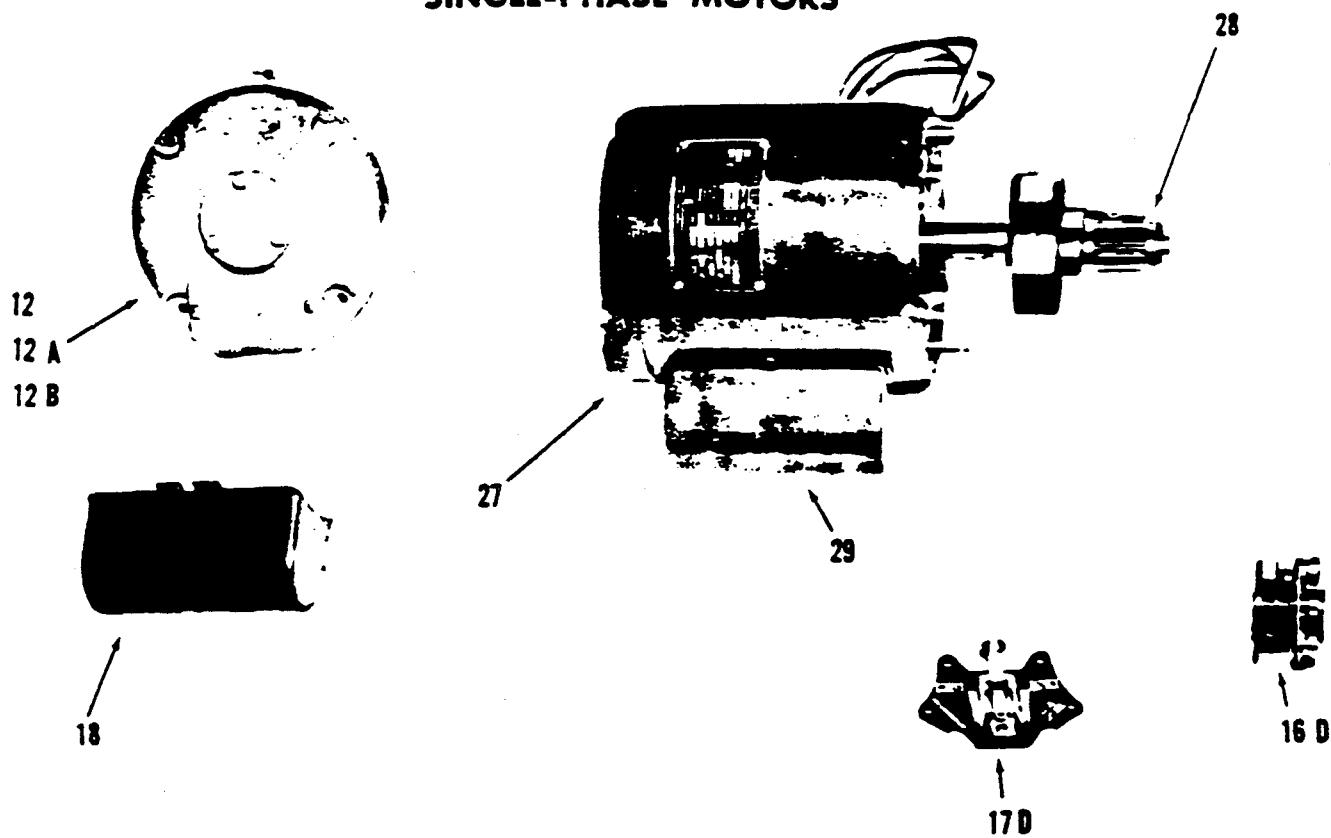

Before using Hoist with new chain installed check chain for twisting. If chain is twisted it was installed wrong.

LUBRICATION OF LINK CHAIN (Use Esso Pen-o-led EP5 or equivalent)

-
1. Place load chain in container. Then pour lubricating oil, completely covering chain.
 2. Remove chain from container allowing excess oil to drain back into container.
 3. Apply lubricated chain to sheave in hoist.
 4. After chain is fastened to hoist, wipe off surface of chain with rag. This will make the outer surface of the chain clean and allow lubrication between the links where the lubrication is necessary.
